HYDRAULIC LIFT HY-6 - 8-4111

To reduce the possibility of seal leakage at the 6621 valve and to improve the performance of the hydraulic lift, we are recommending a new method of connecting the hydraulic hose.

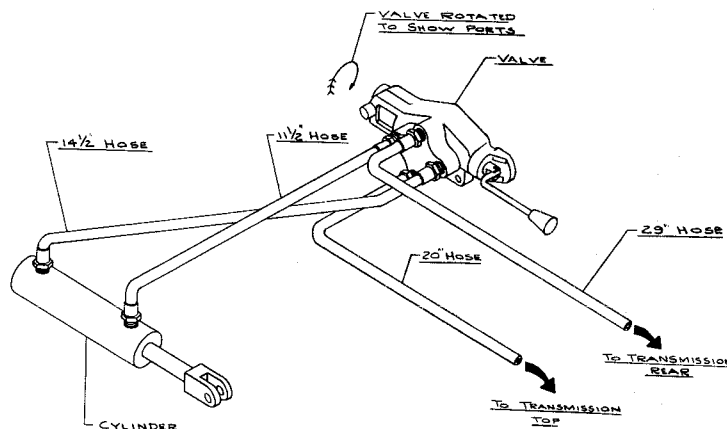

The hydraulic hose should be connected as shown in the accompanying sketch.

Note that the hose lines have been reverse from the original procedure.

New Procedure

1. Connect the 20" hose (pressure line) from the top of the transmission to the inside port of the valve body.
2. Connect the 29" hose (return line) from the rear of the transmission to the outside port of the valve body.
3. Connect the 14½" hose from the front of the cylinder to the rear port of the valve body.
4. Connect the 11½" hose from the rear of the cylinder to the front port of the valve body.

Whenever an HY-6 or 8-4111 is installed the hose connections should be made according to this revised procedure. We also recommend previously installed units be changed over to the new procedure whenever a hydraulic system is being serviced.
